🐙 WilliamMayor

in william-mayor

Summary

I am a highly motivated and knowledgeable senior software engineer, with 13 years' experience in building high quality, accessible web applications using Python, JS, HTML, and CSS, with a focus on the backend. In addition, I have considerable experience with data protection (EU/UK GDPR), data security, and APIs. I'm also an experienced team and project lead.

Skills

Python

Celery Django FastAPI Flask Pytest rq Wagtail

JavaScript

CSS HTML React Svelte(Kit) Tailwind CSS

DevOps

AWS CI/CD DigitalOcean Docker Linux

Databases

Postgres Redis SQL SQLite3

Other

Accessibility (WCAG) Agile Cyber Essentials Data protection (GDPR) Data security
Designing and architecting Internationalisation Project/team lead RESTful APIs

Education

University College London - **MRes Security Science** - 2011-2012 - Merit

University College London - **BSc Computer Science** - 2009-2011 - 1st

Experience - Mayor Tech Limited (2011 - Present)

When I graduated from UCL, I started my own freelance/consultancy company. I've worked with many clients on many varied projects, here are some highlights.

Asahi Super Dry - Lead backend developer on this global marketing platform since 2018, built with Python and Wagtail. Developed custom age verification system ensuring regulatory compliance across 8+ international markets, advanced competition mechanics processing tens of thousands of entries. Created flexible i18n system enabling localised content whilst maintaining brand consistency.

Inside the Edit - I built their Django-based subscription website that takes payments and tax (using Stripe) from customers around the world. I also scaled their video on demand and streaming services whilst reducing the risk of piracy.

RFGraph - I built the entire system behind this RF hardware simulator, using FastAPI and Svelte. It has to very accurately execute thousands of mathematical formulae, in parallel, with sub-100ms latency.

PickTeamz - I built the website and the native iOS and Android that runs this fantasy football game. Using Django, and Flutter, it supports pushing time-sensitive live goal notifications to thousands of users, as well as providing fast access to league tables with non-trivial scoring mechanics.

UDISAS - A Flask-based tool to provide digital needs assessments, replacing human-led face-to-face sessions. It uses a custom DSL (pyparsing) to handle complex decision trees with hundreds of branching questions and answers.

Experience - Diversity and Ability (2011 - 2025)

As the first technical hire for this social enterprise, I built and led the engineering, data protection, and web accessibility teams. I remained hands-on and successfully delivered multiple projects, ensuring enterprise-grade security and compliance.

pistachio - A Flask-based bespoke CRM system I built to handle the complex paperwork and admin requirements of public sector funding. Over the years it expanded to support automated invoicing, calendar scheduling, customer dashboards, and more. It has been used to support more than 40,000 customers and 350,000 hours of one-to-one support.

AXS Passport - I built and scaled a comprehensive digital identity platform from MVP to production, leading an 8-person engineering team and architecting secure, scalable systems handling complex database schemas and in-depth data protection and security concerns.

PartnerHub - A Wagtail-based e-learning platform that provided clients with learning resources, customisable quizzes, and auto-generated participation badges/certificates. The tool supported many HR teams within companies such as TfL.
